

AMPERESAND · TECHNICAL INTERVIEW

Areas of Distinction

Three achievements that define ownership, delivery under pressure, and engineering at scale.

Sai Kiran Reddy Konda **Role:** Engineer

Led HIPAA accreditation from zero to compliant in 4 months

At **Digital HIE Inc**, I led the organization through the rigorous **DirectTrust HISP accreditation** process. I was the primary technical lead and sole author of end-to-end compliance documentation, security policies, operational procedures, and audit evidence for the platform architecture, secure messaging workflows, encryption, and interoperability infrastructure.

Achieved accreditation readiness within *4 months* while simultaneously managing day-to-day engineering and operational responsibilities. No external consultants. No dedicated compliance team.

- HIPAA
- DirectTrust HISP
- Secure Messaging
- Encryption
- Interoperability

Dual-role ownership: I ran engineering and compliance simultaneously. There was no separate compliance team, no external consultants. Every policy, every piece of audit evidence, every architectural decision went through me.

Metric	Detail
Timeline	4 months
Role	Solo technical lead
Scope	End-to-end compliance
Result	Accreditation readiness

Project lead in year one. Mainframe migration in 6 months. During COVID.

My first project lead assignment with less than a year of experience. At **Cognizant for Lincoln Financial Group**, I led a high-priority modernization initiative to migrate Federal Insurance Match and CSLN integrations from legacy **IBM Mainframe and S2K databases** into automated ETL-driven data pipelines.

Wrote hundreds of lines of production Cobol. Coordinated *4 cross-functional teams* spanning *3 time zones* during the COVID-19 pandemic. Delivered within a compressed *6-month* timeline.

- Cobol
- IBM Mainframe
- S2K
- ETL Pipelines
- Federal Insurance

Under one year of experience: Most engineers at that stage are still onboarding. I was leading a cross-timezone migration on legacy systems I'd never touched before, during a pandemic that moved everything remote overnight.

METRIC	DETAIL
Teams	4 cross-functional
Time Zones	3
Timeline	6 months (compressed)
Context	COVID-19 pandemic

Architected systems serving 130M+ accounts. Built to survive region failure.

Challenged and influenced the architecture for next-gen **Transaction and Account Stores**, supporting *130M+ unique accounts* across Card, Bank, Auto, and Global Finance. Delivered end-to-end on AWS in *8 months*.

Designed a reusable **"code-once" architecture** adopted across 4 services on multiple AWS accounts. Built **Terraform infrastructure from scratch** enabling automated cross-region failover us-east-1 to us-west-2.

Independently led the Transaction Store with *~98% test coverage*, and served as a core team member on the Account Store.

- AWS
- Terraform
- DynamoDB
- Go
- Lambda
- Multi-Region

"Code-once" architecture: write the service once, deploy it across four lines of business on separate AWS accounts. Other teams adopted the pattern for their own services.

METRIC	DETAIL
Accounts	130M+
Delivery	8 months
Architecture	Code-once across 4 services
Failover	Multi-region automated
Coverage	~98%

SUMMARY

Ownership. Pressure. Delivery.

Every role pushed me further. I took the lead when it wasn't expected, delivered under constraints that should have slowed things down, and built systems other teams adopted.
